Development, Verification and Validation of a Chemical Reaction Solver Coupled to the Piecewise Parabolic Method

We have developed a detailed chemical kinetics reaction solver coupled to the Piecewise Parabolic Method embedded in the widely used astrophysical FLASH1 code. The resulting product is a powerful and versatile computational tool capable of handling a rich variety of physics that includes gas-phase chemical kinetics, diffusive transport of mass, momentum, and heat, shocks, presence of sharp interfaces, multi-species mixtures, and thermal radiation. The improvements to FLASH enable accurate description of detailed Hydrogen-air and Methane-air chemistry through multiple mechanisms. We have performed extensive validation and verification of the coupled solver, and will present results from these test cases. The FLASH code solves the compressible Euler equations with a directionally split, Piecewise Parabolic Method (PPM2), a high-order extension to the Godunov3 method. Adaptive Mesh Refinement (AMR) is used to resolve local regions with sharp gradients in density or pressure. A nuclear reaction network is solved using a library of coupled ODE solvers, specialized for handling stiff systems of equations. In this work, we have built on the infrastructure of the nuclear reaction network solvers, to enable solutions of stiff chemical reaction mechanisms. The reaction network may be represented as coupled ODEs, that are then solved either through the Kaps-Rentrop (Rosenbrok) method4 or the Bader-Deuflhard method5, supplemented by a sparse matrix package for solving linear systems of equations. Currently, the chemical reaction library includes the H2-air mechanisms of [6], [7], [8], and the CH4-air mechanism of [9]. A gamma-law Equation of State solver was modified to describe multiple species, each with temperature-dependent properties. Heat addition during combustions also necessitates temperature-dependent transport properties such as viscosity, thermal conductivity, and mass diffusion of constituent species. Through a comprehensive expansion of the materials database in FLASH, a polynomial dependence on the temperature10 for the above properties was implemented. The diffusion of heat, mass, and momentum is handled either through an update of the fluxes of each quantity, or by directly solving a diffusion equation for each. The relative merits of each approach will be discussed. We will present results from verification and validation of the above capabilities through comparison with analytical solutions, and published numerical and experimental data. Our verification cases include comparison of thermodynamic properties calculated using the temperature-dependent EOS with data from NIST11, viscous spreading of a laminar jet, viscous decay of a potential vortex, temporal evolution of species and temperature in a well stirred reactor, comparison of adiabatic flame temperature data and auto-ignition delay. Our validation cases include advection of reacting and non-reacting 1-D fronts, advection of 2D circular temperature spot in a directional background flow, laminar premixed hydrogen-air and methane air flames in a Bunsen burner configuration and shock-driven combustion of an initially circular hydrogen bubble.

General Organic and Biological Chemistry

An Integrated Approach

John Wiley & Sons General, Organic and Biological Chemistry, 4th Edition has been written for students preparing for careers in health-related fields such as nursing, dental hygiene, nutrition, medical technology and occupational therapy. It is also suited for students majoring in other fields where it is important to have an understanding of the basics of chemistry. An integrated approach is employed in which related general chemistry, organic chemistry, and biochemistry topics are presented in adjacent chapters. This approach helps students see the strong connections that exist between these three branches of chemistry, and allows instructors to discuss these, interrelationships while the material is still fresh in students' minds.

Mapping College Chemistry

Using Graphic Organizers to Solve and Understand the Toughest Unit Problems in General Chemistry

Universal-Publishers This text is a chemistry problem solving resource appropriate for teachers and their students who are enrolled in high school Advanced Placement Chemistry or in a first-year college General Chemistry course. The book incorporates a chemistry problem solving plan, one that uses an innovative graphic organizer strategy. The strategy - successfully evaluated with students - combines problem solving processes with chemical concepts that will allow students to solve the most common and difficult problems encountered in the first year of chemistry. Topical problem solving will focus on limiting reactant stoichiometry, identifying types of chemical reactions, equilibrium, acid-base equilibria, and electrochemistry. Why would this resource be of interest to chemistry students? To be successful (to get into a well known college, medical school, physical therapy or graduate program) often requires that students get an "A" in your pre-requisite Introductory General Chemistry course. To make matters worse, many college professors feel that only a few students should get A grades, and therefore, they give difficult exams that many students fail; this is the weeding out process that every pre-health student is apprehensive about. To succeed in this competitive environment entails not just studying harder or longer, it means re-organizing textbook content so that it is meaningful to the student. This is the first text of its kind to employ a reliable, research-based strategy that incorporates a decision-based visual tool to solve chemistry textbook problems, ones that can make or break a career.

Symbolic Computation

Solving Equations in Algebra, Geometry, and Engineering : Proceedings of an AMS-IMS-SIAM Joint Summer Research Conference on Symbolic Computation: Solving Equations in Algebra, Geometry, and Engineering, Mount Holyoke College, South Hadley, MA, June 11-15, 2000

American Mathematical Soc. This volume contains papers related to the research conference, 'Symbolic Computation: Solving Equations in Algebra, Analysis, and Engineering', held at Mount Holyoke College (MA). It provides a broad range of active research areas in symbolic computation as it applies to the solution of polynomial systems. The conference brought together pure and applied mathematicians, computer scientists, and engineers, who use symbolic computation to solve systems of equations or who develop the theoretical background and tools needed for this purpose. Within this general framework, the conference focused on several themes: systems of polynomials, systems of differential equations, non commutative systems, and applications.

A Computer Program for Solving the Reaction Rate Equations in the E Ionospheric Region

In studies of the mechanisms responsible for the formation of the ionized regions of the atmosphere, one of the problems encountered is the solution of the set of differential equations describing the time dependence of the number density of the chemical species present. For simple cases where only one or two species are involved, there is no particular problem. When all the important constituents are included, however, the solution of these equations becomes very complex. A computer technique is presented that will solve any size set of these differential equations involving any number of chemical reactions. (Author).
