PARTISIPASI KELUARGA DALAM PERAWATAN PASIEN STROKE

Penerbit NEM Stroke yang disebut Gangguan Peredaran Darah Otak (GPDO), di negara maju merupakan penyebab kematian nomor 3 setelah penyakit jantung dan kanker pada kelompok usia lanjut dan penyebab kecacatan nomor 1 di seluruh dunia. Sedangkan di Indonesia menduduki peringkat ketiga, namun penyebab kematian yang utama di rumah sakit. Angka kejadian stroke di Indonesia meningkat dengan tajam dari tahun ke tahun. Di Indonesia stroke merupakan penyakit nomor tiga yang mematikan setelah penyakit jantung dan penyakit kanker, namun penyebab kecacatan nomor satu. Diperkirakan 500 ribu orang terserang stroke setiap tahunnya. Bahkan menurut survei tahun 2004, stroke merupakan pembunuh nomor 1 di rumah sakit pemerintah di seluruh Indonesia. Faktor yang dapat menyebabkan terjadinya perawatan stroke yang tidak maksimal adalah kurangnya pengetahuan keluarga. Keluarga sebagai orang yang terdekat dengan klien seharusnya tahu informasi lengkap tentang stroke dan ikut serta dalam perawatan anggota keluarganya, tetapi kenyataannya keluarga klien sering tidak memiliki informasi yang adekuat tentang stroke. Buku ini memberikan gambaran mendetail tentang Hubungan Pengetahuan dan Sikap Keluarga dengan Keikutsertaan Perawatan Pasien Stroke. Kekurangan buku ini adalah belum menyajikan lebih mendalam mengenai kasus stroke berdasarkan macam-macam stroke dan penanganannya. Serta belum membahas terkait perawatan stroke untuk di rumah.

PERANAN GIZI DALAM UPAYA PENCEGAHAN PENYAKIT TIDAK MENULAR

UGM PRESS Penyakit tidak menular menjadi penyebab utama kematian di dunia. Data WHO menyebutkan hampir 80% kematian akibat penyakit tidak menular berada pada negara berpenghasilan rendah atau menengah. Pada tahun 2008, 36 juta dari 57 juta jiwa meninggal akibat penyakit ini. Jenis penyakit tidak menular meliputi penyakit kardiovaskular, diabetes, kanker, dan penyakit pernapasan akut. Jumlah ini meningkat pada tahun-tahun berikutnya. Data WHO pada tahun 2012 menyebutkan peningkatan prevalensi penyakit tidak menular dapat dilihat pada perubahan tren sepuluh penyakit terbesar penyebab mortalitas. Terjadi peningkatan prevalensi yang cukup besar pada penyakit jantung koroner, stroke, diabetes melitus, dan hipertensi selama satu dekade (2002-2012). Sementara itu, prevalensi penyakit infeksi seperti tuberkulosis dan diare mengalami penurunan. Tingginya prevalensi penyakit tidak menular tidak terlepas dari berbagai faktor risiko, seperti merokok, aktivitas fisik yang rendah, alkohol, dan diet atau pola makan. Beberapa penelitian menyebutkan pola makan sebagai faktor utama terjadinya penyakit tidak menular. Bila hal ini tidak ditangani, dampak yang lebih besar mungkin terjadi, seperti komplikasi dan mortalitas, yang secara langsung akan berpengaruh terhadap kualitas sumber daya manusia suatu negara. Buku ini berisi pentingnya gizi dalam mencegah dan menangani penyakit tidak menular, seperti hipertensi, diabetes melitus, penyakit jantung koroner, dan obesitas yang jumlahnya terus meningkat dalam satu dekade terakhir. Perjalanan penyakit, faktor risiko, komplikasi, deteksi dini, sampai dengan intervensi gizi (pengaturan pola makan) tersaji lengkap dalam buku ini.

HYPERTENSION CONTROL

REPORT OF A WHO EXPERT COMMITTEE

A state-of-the-art review of research findings that contribute to an understanding of hypertension and the best measures for its prevention and control, whether in individual patients or entire populations. Noting that elevated blood pressure is a massive health problem in almost every country, the report argues that programs for hypertension control should be an integral part of all national health care systems. With this goal in mind, the report aims to help policy makers appreciate the significance and complexities of hypertension, understand the options available for control and then select the most appropriate mix of interventions. Details range from recommended procedures for obtaining an accurate assessment of blood pressure through advice on the best drugs for first-line treatment of hypertensive patients to a discussion of ways to educate populations about relevant lifestyle changes. Throughout the report, population-based and individual approaches are presented as complementary, synergistic strategies for hypertension control. To assist physicians as well as policy makers, the report includes abundant recommendations based on the best scientific evidence for the management of different patient groups. A section on the clinical assessment of the hypertensive patient explains the components of a coherent step-wise diagnostic process involving history taking, physical examination and laboratory investigation. Included are an assessment of the most suitable drugs for first-line treatment and guidelines for developing management plans for mild hypertension, moderate and severe hypertension, resistant hypertension and hypertensive emergencies. In view of the need to assure that scarce resources are invested wisely, the report also discusses and compares the cost-effectiveness of different management strategies.

FROM HYPERTENSION TO HEART FAILURE

Springer Science & Business Media Arterial hypertension, coronary heart disease and heart failure are the commonest cardiovascular conditions to present in clinical practice. Over the past few years it has become increasingly clear that they are closely and causally interrelated and that their relationship can have a significant bearing on prognosis. Epidemiological studies have shown that arterial hypertension is one of the most important risk factors for developing heart failure. Only one in four patients with hypertension is adequately managed, and in 50% of cases, the hypertension has not been recognised or treated. Patients with pre-existing hypertension who go on to suffer an acute myocardial infarction have usually not previously had typical angina symptoms, the infarct territory is larger, life threatening arrhythmias are commoner and hence in-hospital mortality and long-term prognosis are markedly worse. The presence of raised blood pressure in the post-infarct phase doubles the risk of manifest heart failure. The close relationship between hypertension, coronary heart disease and heart failure makes the choice of therapeutic strategy particularly important. Agents and classes of agents that have prognostic value in all three conditions should be considered first, as synergy might result in additional benefits. In such patients, this sort of therapeutic decision-making might have further advantages. The use of these agents may prevent complications which are not yet clinically obvious (such as heart failure).

Elsevier España *Principles and Practice of Psychiatric Nursing, 8th Edition* provides comprehensive coverage of psychiatric nursing. Beginning with fundamental coverage of all key psychiatric nursing principles, it goes on to address the complete continuum of care - including mental health promotion and illness prevention, crisis intervention, and psychiatric rehabilitation and recovery. The book then applies psychiatric nursing principles to specific clinical disorders based on adaptive-maladaptive coping responses, the six-step nursing process, and DSM-IV-TR and NANDA diagnoses. Subsequent chapters describe various modalities of treatment (psychopharmacology, somatic therapies, cognitive and behavioral therapies, managing aggressive behavior, and more), hospital-based and community-based care, and treatment of special populations. The *Stuart Stress Adaptation Model* provides a consistent nursing-oriented framework for understanding health and wellness. Evidence-based algorithms are presented in lieu of the less relevant critical pathways found in other texts. The latest American Nurses Association's Standards of Care prepare students for the realities of evidenced-based care in nursing practice. A vibrant, full-color design enhances and enriches students' understanding of essential concepts. Short vignettes in a patient's and family's own words give readers a different perspective of the caregiving process. Case studies present in-depth clinical scenarios that show each step of the nursing process, demonstrating realistic applications of the nursing process. Critical thinking questions interspersed throughout the text encourage independent clinical reasoning. Numerous boxes and tables throughout the book highlight important issues and current topics related to chapter content in visual, easy-to-digest segments. Citing the Evidence boxes provide summaries of recent clinical research, with new boxes added to the *Evolve* website each month. *Nursing Treatment Plan Summaries* present care plans, including patient goals with nursing interventions and rationales, to guide nursing care related to the treatment of major disorders. *Patient Education Plans* and *Family Education Plans* include key information nurses need to communicate to the patient and family members. *Sample Therapeutic Dialogues* for nurse-patient interactions demonstrate the difference between therapeutic and nontherapeutic communication. Clinical chapters have been carefully

revised and updated to include the latest research and appropriate nursing and medical diagnoses relevant to each disorder. The book will aim to critically evaluate interventional research (behavioural and other therapies) and provide evidence based recommendations on how to manage stress in the cardiovascular patient. MINI NUTRITIONAL ASSESSMENT (MNA)

RESEARCH AND PRACTICE IN THE ELDERLY

Karger Medical and Scientific Publishers This book is the first of a new series which will present the proceedings of the newly established Nestlé Nutrition Workshop Series: Clinical & Performance Programme aimed at adult nutrition. Undernutrition is a common phenomenon in elderly people, and malnutrition reaches significant levels in those being in hospital, nursing homes or home care programs. Consequences of malnutrition often go unrecognised owing to the lack of specific validated instruments to assess nutritional status in frail elderly persons. The Mini Nutritional Assessment (MNA) provides a single, rapid assessment of nutritional status in the elderly of different degrees of independence, allowing the prevalence of protein-energy malnutrition to be determined and to evaluate the efficacy of nutritional intervention and strategies. Easy, quick and economical to perform, it enables staff to check the nutritional status of elderly people when they enter hospitals or institutions and to monitor changes occurring during their stay. Moreover, the MNA is predictive of the cost of care and length of stay in hospital. This publication will be of immense assistance to heads of geriatric teaching units, teachers in nutrition, clinicians general practitioners and dieticians, enabling them to better detect, recognise and start treatment of malnutrition in the elderly.
